

I need to create a professional website to get a job as a graphic or brand designer.

I have attached the logo images I want to use in my website, along with spacing guidelines and a full brand identity guide. Please use the contents of that guide to create a website with an easy to use system that allows me to edit the content without changing the code.

The contents of the projects change in dimension, resolution, and page quantity. I need a solution that can combine each of these diverse projects into one scrollable gallery, with a solution for hiding the descriptions and preserving the visual hierarchy between the multiple page projects and the singular page projects.

I also would like the user to filter my projects based on what tools and skills are used.

I do not want the quantity of pages of each project to separate them or make them stand too much from the singular images, but the larger projects don't look good if most of the contents are cropped out into a single picture.

So far, the projects I wish to include are:

- 4 singular images with descriptions
- the Avery Ember Day Brand Identity Guide (as attached, with a description)
- a 3-part instagram carousel reel, 10 images each (with a description, moodboard, and storyboard)

It must contain:

a portfolio gallery

a short about me paragraph

a link to my LinkedIn

a way to email me at averyemberday@gmail.com for my professional resume or to inquire about my availability to be commissioned.

I would also like an easy content customization system that only I can access where I can upload a new project to the gallery with a quick system for hiding and deleting projects. prioritize ease of use and minimal external dependencies.

Before you start, present a detailed plan.
